

PLATEN TYPE

Although an early approach to demagnetisation, the platen design still lends itself to certain limited applications and is particularly suitable for use with hardened steel rings and similar components such as those encountered in the ball and roller bearing industries.

Available in three standard sizes or multiple banks thereof, the flat hard-wearing working surface of the platen type lends itself either to manual operation or to incorporation in a conveyor belt system. Further details of such applications are available on request.

DEMAGNETISERS WITH RUNWAY & TROLLEY OR MOTORISED CONVEYORS

These models are available, built to customers specifications.
